Implement Client Script & UI Policy (Incident)

Project Testing and Implementation Report

6. Project Testing Phase

Objective

The testing phase verifies that the configured Client Script and UI Policy behave correctly on the Incident form under different conditions. Testing is performed by creating and updating Incident records to ensure that the required fields and form behaviour work as expected.

Activities Performed

• Test the Incident form with different field values.

• Verify that the Client Script executes correctly when the specified form action occurs.

• Verify that the Client Script performs the intended client-side action.

• Test the UI Policy with the specified condition.

• Verify that the required fields become mandatory when the condition is satisfied.

• Verify that fields are displayed or hidden according to the configured UI Policy.

• Verify that fields become read-only when the configured condition is satisfied.

• Test the form when the UI Policy condition is not satisfied.

• Verify that fields remain in their intended normal state when the condition is not satisfied.

• Test the Client Script and UI Policy with different Incident records.

• Verify that the configuration does not produce unexpected changes to unrelated fields.

• Record the expected and observed results for each test case.

• Identify and correct configuration or scripting issues if a test fails.

• Repeat the tests after corrections and capture the final evidence.

Implementation / Detailed Description

In this phase, the Incident table is used to implement and verify the Client Script and UI Policy configuration. The Client Script is configured to perform a client-side action when the selected field changes. In the implemented configuration, the Client Script is named "Auto set urgency for high impact" and is configured for the Incident table.

The Client Script uses the onChange type and the Impact field as the triggering field. Therefore, when the Impact value is changed, the configured client-side logic can evaluate the selected value and apply the required action to the Incident form.

The UI Policy is used to control the behaviour of Incident form fields based on a defined condition. Depending on the requirement, a UI Policy can make a field mandatory, visible, or read-only. The configuration is tested with both satisfied and unsatisfied conditions to ensure that the intended behaviour is applied without incorrectly affecting other fields.

Expected / Produced Output

The expected output is that the Client Script performs the configured action when the Impact field changes, while the UI Policy applies the specified field behaviour when its condition is satisfied. When the condition is not satisfied, the Incident form should remain in its intended normal state. The final test evidence confirms the expected behaviour.

Screenshots / Evidence

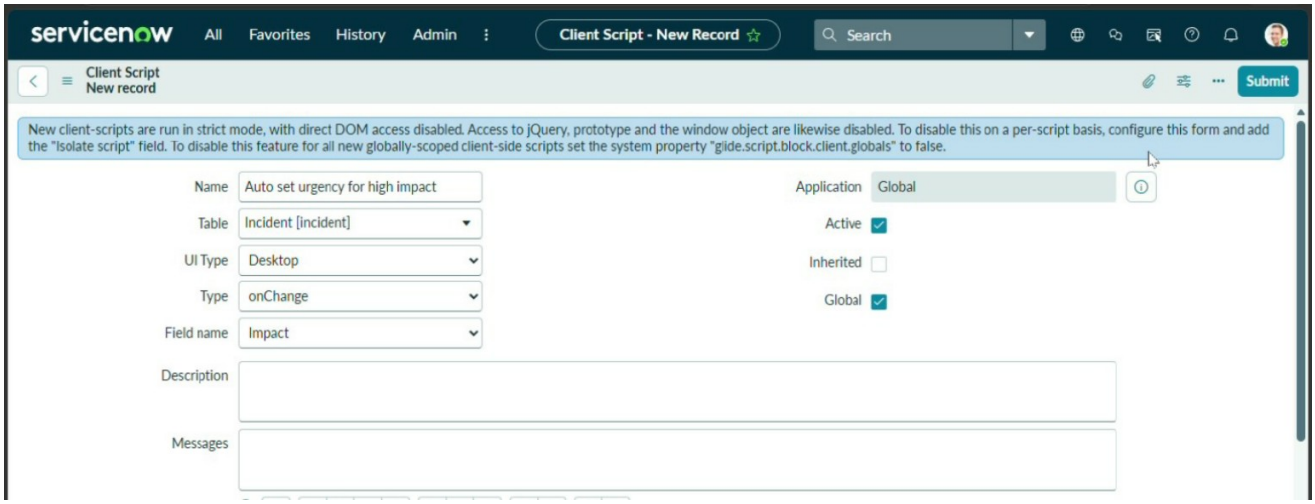

Figure 1: Client Script Configuration for Incident Table

The screenshot shows the Client Script configuration for the Incident table. The script is active, uses the Desktop UI type, is configured as an onChange Client Script, and uses the Impact field as the triggering field.

Test Result

Test Case	Expected Result	Observed Result
Client Script configuration	Client Script should be active and configured on Incident.	Configuration is displayed correctly.
Impact field change	Client Script should execute on Impact change.	Configured as onChange with Impact field.
UI Policy condition satisfied	Configured field behaviour should be applied.	To be verified using the Incident form.
UI Policy condition not satisfied	Field should return/remain in the normal state.	To be verified using the Incident form.

Result

The Client Script configuration for the Incident table was successfully prepared and verified at the configuration level. The Client Script is active and is configured to run when the Impact field changes. The UI Policy testing is performed separately to confirm the required field behaviour under the defined conditions. The screenshots and test observations provide implementation evidence for the project.
