8. Project Demonstration Phase

Objective

To implement **Client Script** and **UI Policy** on the ServiceNow **Incident** table to dynamically control form fields based on incident conditions.

The main objectives are:

- Make **Assignment Group** mandatory for Critical-priority incidents.
- Make **Resolution Code** and **Resolution Notes** mandatory when an incident is resolved.
- Provide dynamic form behavior without requiring the page to reload.
- Improve data consistency and ensure important Incident information is entered before submission.

2. Activities Performed

- Created a **Client Script** on the Incident table.
- Configured the Client Script as an **onChange** script for the Priority field.
- Added logic to make **Assignment Group** mandatory when Priority is Critical.
- Created a **UI Policy** for resolved incidents.
- Configured UI Policy Actions for:
    - Resolution Code
    - Resolution Notes
- Enabled **Reverse if false** so that the field behavior changes back when the condition is no longer satisfied.
- Tested the Client Script and UI Policy using different Incident conditions.
- Verified the expected behavior on the Incident form.

3.Implementation / Detailed Description

A. Client Script Implementation

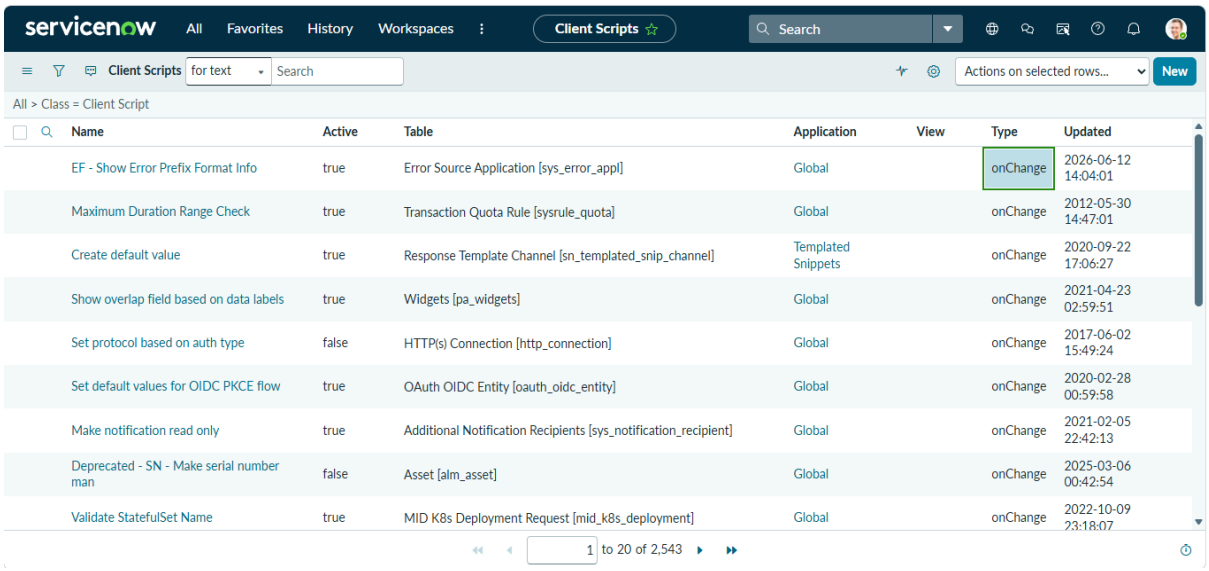

A Client Script named **"Incident – Priority Validation"** was created on the **Incident [incident]** table to control the form behavior dynamically based on the selected Priority. The script is configured as an **onChange** Client Script, which means it executes whenever the value of the Priority field is changed by the user. The **UI Type** is set to **All**, allowing the script to work across supported ServiceNow interfaces, and the script is marked **Active** so that it can execute on the Incident form. When the Priority is changed to the specified critical level, the Client Script makes the **Assignment Group** field mandatory and displays an informational message to the user. This ensures that important incidents are assigned to an appropriate group before further processing.

4.Expected / Produced Output

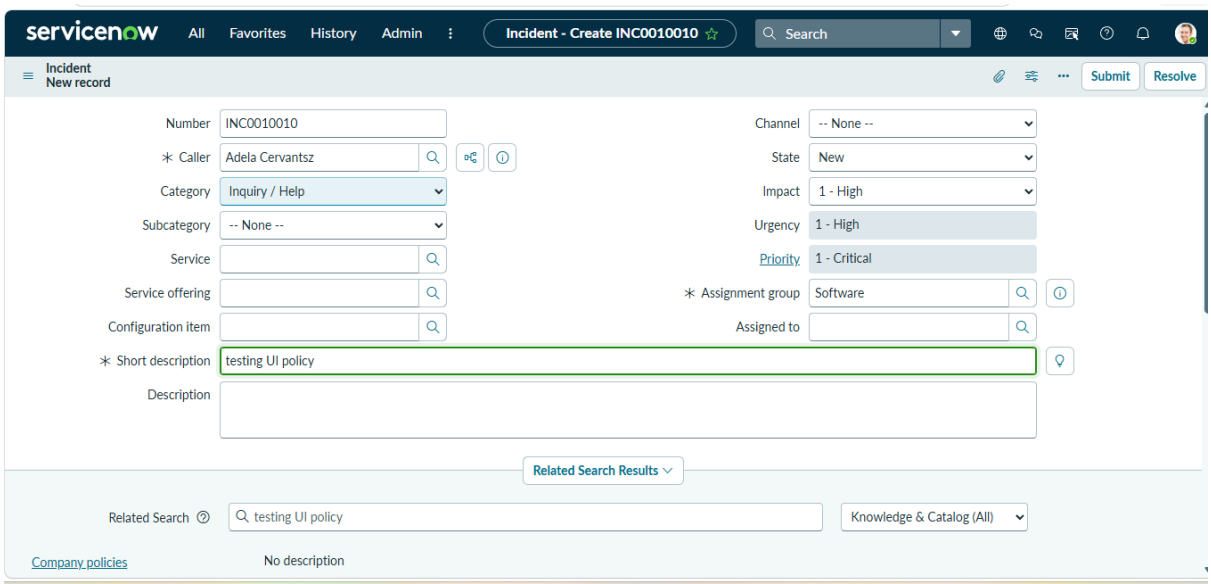

The Client Script and UI Policy successfully provide dynamic Incident form behavior by making **Assignment Group** mandatory for Critical incidents and **Resolution Code/Notes** mandatory for Resolved incidents. Other conditions retain the normal field behaviour.

Client Script Configuration

Incident Form

6. Result

The **Client Script and UI Policy were implemented successfully on the Incident table**.

The Client Script dynamically controls the **Assignment Group** field based on Priority, while the UI Policy dynamically makes **Resolution Code** and **Resolution Notes** mandatory when an Incident is resolved. The implementation was tested using different Incident conditions and produced the expected form behavior.
