2. Requirement Analysis Phase

Project Title

Implement Client Script & UI Policy (Incident)

Requirement Analysis

- The main requirement of this project is to implement Client Script and UI Policy in the ServiceNow Incident application to control the behaviour and appearance of incident form fields.
- The system should provide a user-friendly incident form where fields can be automatically controlled based on specific conditions. Client Scripts can be used to perform client-side actions such as setting field values, making fields mandatory, hiding fields, or displaying messages. UI Policies can be used to dynamically change the visibility, mandatory status, and read-only status of fields.

Functional Requirements

1. The system should allow users to create and update Incident records.
2. The Client Script should execute based on the specified form event or condition.
3. The Client Script should control incident field values according to the defined requirement.
4. The UI Policy should dynamically change the field behaviour based on conditions.
5. Required fields should become mandatory when the specified condition is satisfied.
6. Fields should be shown, hidden, enabled, or disabled according to the defined UI Policy.
7. The implemented Client Script and UI Policy should work correctly on the Incident form.
8. The changes should be tested using different Incident form conditions.

Non-Functional Requirements

1. The system should be easy to use.
2. The form should respond quickly to user actions.
3. The Client Script and UI Policy should work consistently.
4. The implementation should not affect unrelated Incident form fields.
5. The configuration should be easy to maintain and modify.

Expected Outcome

The project should successfully implement Client Script and UI Policy on the Incident form, allowing fields to behave dynamically according to the specified conditions. This improves the consistency and usability of the Incident management process.
